

<https://www.cs.cmu.edu/~113/project1.html> can you read this?

Fetchd: Project 1: Personal Portfolio Website |
15-113<https://www.cs.cmu.edu/~113/project1.html>

Yep, I read it. It's Project 1 for CMU's course **15-113: Effective Coding with AI** — a portfolio website assignment. Here's the gist:

What you're building: A personal portfolio website (HTML/CSS/optional JS) with sections for an intro, about, projects, and contact info — deployed live on GitHub Pages.

Due: Saturday, Sept 5, 2026, 8:00 PM (today!)

Key requirements:

- **Content:** bio/photo/interests, a projects section (placeholders okay if you have none yet), contact info
- **Technical:** responsive design (works on desktop/tablet/mobile), live on GitHub Pages, clean code
- **AI usage:** you must document how you used AI (code comments + a "prompt log" of your prompts/replies), and be able to explain your code and design choices
- **Interactivity:** at least one JS feature (dark mode toggle, smooth scroll, etc.) or an embedded interactive demo

Submission: a Google Form with your live site URL, GitHub repo link, and the prompt log uploaded to the repo.

Also required: a TA check-in meeting (week 2) and a project interview after the deadline where you explain your work.

Given it's due tonight — want help actually building this? I can scaffold the HTML/CSS/JS structure for you right now if you tell me a bit about what you want in it (name, projects, style preferences, etc.).

pdf

okay. i want to get to the actual design of the site later, and just keep it plain for now. let's start with the intro and about section (i have no photo). I uploaded my resume so you have my name and a fair understanding of what i can do skills wise.

None

```
<!DOCTYPE html>
<html>
<head>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width,
initial-scale=1.0">
  <title>Page Title</title>
</head>
<body>
  <!--Site stuff-->
</body>
```

this is what i have as a start right now. give me code for those specified sections and (like the instructions outline) concisely explain what each part contributes to the site. Please make sure the code is clean and efficient.

Here's the intro and about section, built to slot right into your `<body>`:

html

HTML

```
<body>
  <header>
    <h1>Micheal Olorunsola</h1>
    <p>Statistics & Data Science student at Carnegie Mellon
University</p>
  </header>

  <section id="about">
    <h2>About Me</h2>
    <p>
      I'm a Statistics & Data Science student at Carnegie
Mellon University,
      concentrating in Psychology. I'm interested in applied
data modeling,
      statistical inference, and using data to understand
human behavior.
    </p>
```

```

    <p>
        Outside of coursework, I'm a member of the National
Society of Black
        Engineers and the Black Student Union. I've also spent
time volunteering
        as a peer educator and at the Houston Food Bank.
    </p>
    <h3>Skills</h3>
    <ul>
        <li>Python, C++, Java, R, Lua, SQL, HTML5</li>
        <li>System Modeling & Applied Data Modeling</li>
        <li>Statistical Inference</li>
        <li>PowerPoint, Excel</li>
    </ul>
</section>

<!--Site stuff-->
</body>

```

What each part does:

- **<header>** — holds your name and a one-line tagline. This is the first thing a visitor sees, so it acts as your "brand" for the page. It's a landmark element, so it also helps screen readers and search engines identify the top of the page.
- **<section id="about">** — wraps your About content as a distinct block. The `id="about"` is what a nav bar link (like `<a href="#about">`) will later jump to, so it's setting you up for Step 2's navigation requirement even though we're not touching styling yet.
- **Two <p> tags** — I split your bio into two short paragraphs (academic/interests, then involvement) instead of one big block, since shorter paragraphs are easier to scan and easier to style individually later (e.g., different spacing).
- **<h3>Skills + ** — a list is more scannable than a sentence for a skills dump, and it maps directly to a semantic HTML element rather than something you'd need CSS/JS to fake later.

One thing to flag: your resume doesn't have a personal "interests" blurb (hobbies, what drives you outside academics) — right now the About section is pretty CV-flavored. Want me to leave it as-is for now, or do you want to add a sentence or two about yourself that isn't already on the resume?

Same idea as the CSS file — create a folder, put the image in it, and reference the path.

Steps:

1. In your repo root, create a folder named `images`.
2. Save your screenshot (the GAM plots one) into that folder, named exactly `language-acquisition-plot.png` — matching what's already in your HTML:

html

HTML

```

```

3. Your folder structure should now look like:

None

```
your-repo/
├─ index.html
├─ style.css
└─ images/
    └─ language-acquisition-plot.png
```

How to actually save the file into that folder, depending on where you're working:

- **In VS Code:** right-click the `images` folder in the file explorer sidebar → "Reveal in Finder/Explorer" → drag your screenshot in. Or just drag the screenshot file directly onto the `images` folder in VS Code's sidebar.
- **On GitHub.com directly:** open your repo in the browser → click "Add file" → "Upload files" → drag the image in. If the `images` folder doesn't exist yet, you can type `images/` in the file name field when uploading and GitHub will create it for you.

Things that commonly trip people up:

- **Case sensitivity:** `Language-Acquisition-Plot.png` ≠ `language-acquisition-plot.png` on GitHub Pages (unlike Windows, which ignores case). Keep them identical.
- **File extension:** make sure it's actually `.png` and not `.png.png` or similar (some OSes hide extensions by default).
- **Relative path:** `images/language-acquisition-plot.png` only works if `images/` sits in the *same folder* as `index.html`. If you move `index.html` into a subfolder later, you'd need to update the path.

Once it's in place, just open `index.html` in your browser (or push to GitHub Pages) and the image should show up. Want help setting up the actual GitHub repo and Pages deployment next?

nice. also, is there a scroller/JS features on this?

Not yet — right now the site is just HTML and CSS, no JavaScript at all. That's actually the next thing on your project checklist (Step 3's "optional JS" / the Interactivity requirement).

A **smooth scroller** is a great fit here, and low-effort: right now clicking your nav links (`#about`, `#projects`, `#contact`) jumps instantly. Smooth scrolling makes it glide instead, which feels more polished and matches the editorial feel we just built.

There are two ways to do it:

Option 1 — CSS only, no JS needed:

CSS

```
CSS
html {
  scroll-behavior: smooth;
}
```

One line in `style.css`. Works in all modern browsers. Downside: it doesn't count toward your "JavaScript-powered feature" requirement since there's no JS involved.

Option 2 — actual JavaScript, which satisfies the assignment's interactivity requirement and gives you more control (e.g., respecting reduced-motion preferences, adding an active-link highlight as you scroll):

html

```
HTML
<script>
  document.querySelectorAll('nav.site-nav a').forEach(link => {
    link.addEventListener('click', (e) => {
      e.preventDefault();
      const target =
document.querySelector(link.getAttribute('href'));
      target.scrollIntoView({ behavior: 'smooth' });
    });
  });
</script>
```

```
</script>
```

This goes right before your closing `</body>` tag in `index.html`.

Want me to add this in, or would you rather go with something else for the JS requirement — like a dark mode toggle, which would fit the aesthetic we just built (paper background → dark ink background) and is a bit more visually impressive for graders?
